

Fully specified spraybooth conversions ...

... for a fraction of the price
of a standalone spraybooth

Workbay Conversions

STL's flexible approach to design means that we can convert an enclosed workbay into a fully functional spraybooth, complete with spray and bake cycle, for a fraction of the cost of an equivalent standalone spraybooth. All conversions are specifically designed to suit the individual requirements of each site.

Filter System

An air plenum suspended above the front of the work area creates high velocity airflow around the body of the work piece. Typically this is extracted to the rear of the workspace, although side extraction and underfloor extraction are often employed, depending on site requirements.

Air handling plant

Sized to suit the specific project requirements, we can install either a low cost recirculating system with a 10-15% fresh air bleed, or a fully specified twin-fan total-loss air handling plant. Either way, STL guarantees high performance, high efficiency and low maintenance.

Heating

We can provide direct-fired gas or propane burners, or indirect fired oil burners, to regulate spray temperatures and provide a low bake cycle.

Control Panel

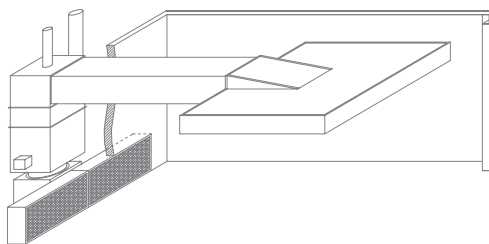

A user friendly, hard-wired unit electronically maintains temperature and pressure.

Lighting

STL's innovative lighting systems combine excellent lighting levels with low operating costs.

Service

A team of regionally based Corgi registered engineers provides service, back up and support.
